Introduction

Welcome to the documentation of [SIMDiff.jl](#)

Note

This documentation is also available in [PDF format](#).

Chapter 2

What is SIMDiff?

SIMDiff.jl implements SIMD abstraction of nonlinear programs and the automatic differentiation of its functions. SIMDiff.jl expresses the functions in the form of iterables over statically typed data. This allows highly efficient derivative computations based on reverse-mode automatic differentiation.

Quick Start

Chapter 4

Getting Started

SIMDiff can create nonlinear programming models and allows solving the created models using NLP solvers (in particular, those that are interfaced with NLPModels, such as [NLPModelsIpopt](#)). We now use SIMDiff to model the following nonlinear program:

$$\begin{aligned} \min_{\{x_i\}_{i=0}^N} \quad & \sum_{i=2}^N 100(x_{i-1}^2 - x_i)^2 + (x_{i-1} - 1)^2 \\ \text{s.t.} \quad & 3x_{i+1}^3 + 2x_{i+2} - 5 + \sin(x_{i+1} - x_{i+2})\sin(x_{i+1} + x_{i+2}) + 4x_{i+1} - x_i e^{x_i - x_{i+1}} - 3 = 0 \end{aligned}$$

We model the problem with:

```
| using SIMDiff
```

We set

```
| N = 10000
```

```
| 10000
```

First, we create a `SIMDiff.Core`.

```
| c = SIMDiff.Core()
```

```
| SIMDiff.Core{Float64, Vector{Float64}, Nothing}(SIMDiff.ObjectiveNull(), SIMDiff.ConstraintNull(),  
| 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, Float64[], Float64[], Float64[], Float64[], Float64[], Float64[],  
| nothing)
```

The variables can be created as follows:

```
| x = SIMDiff.variable(  
|   c, N;  
|   start = (mod(i,2)==1 ? -1.2 : 1. for i=1:N)  
| )
```

```
| SIMDiff.Variable{Tuple{Int64}, Int64}((10000,), 0)
```
